Whenever I go out to buy my daily groceries with my cousin brother, he has the need to always search up the Top Ten best brand for that specific category, for example, we were at the bread aisle, normally you wouldn't expect someone to search up what the best bread brand that is out there, you would just choose a bread that looks appealing to you. However, my brother has this instinct to choose the best of the best and therefore goes on the internet and manually searches for the top ten best brands for that product. This is all a hassle when you're in the supermarket standing up and searching for which bread to get, it is also very time consuming due to the immense ads that pop op for searching the top ten best. My proposal is to make a program that already has the keywords "Top Ten Best" and allows the user to just type in the type of product they want to know; it will redirect it to google and print out the top ten best products for that category in a clear organized list. This not only saves tons of time, but it also makes it very efficient for the user. Of course, I will replicate this in java using multiple classes and use an input text file to aware the user of what the best products will be.
